> Q1: What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy.

My pdb stats data frame has numbers with commas in them. This may cause us problems. Let's see:

```
pdb$X.ray
```

```
[1] "161,663" "9,348"   "8,404"   "2,758"   "164"     "11"
```

```
x <- as.numeric("20000")
```

```
as.numeric(pdb$X.ray)
```

```
Warning: NAs introduced by coercion
```

```
[1]  NA  NA  NA  NA 164  11
```

We found a function called `gsub()` now we can figure out how it works

```
as.numeric(gsub(",","",pdb$X.ray))
```

```
[1] 161663   9348   8404   2758    164     11
```

I can turn this snippet into a function that I can use for every column in this table

```
commasum <- function(x){
  sum(as.numeric(gsub(",","",x)))
}

commasum(pdb$X.ray)
```

```
[1] 182348
```

Apply across all columns

```
totals <- apply(pdb,2,commasum)
```

```
Warning in FUN(newX[, i], ...): NAs introduced by coercion

Q2: What proportion of structures in the PDB are protein?

86.7

Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

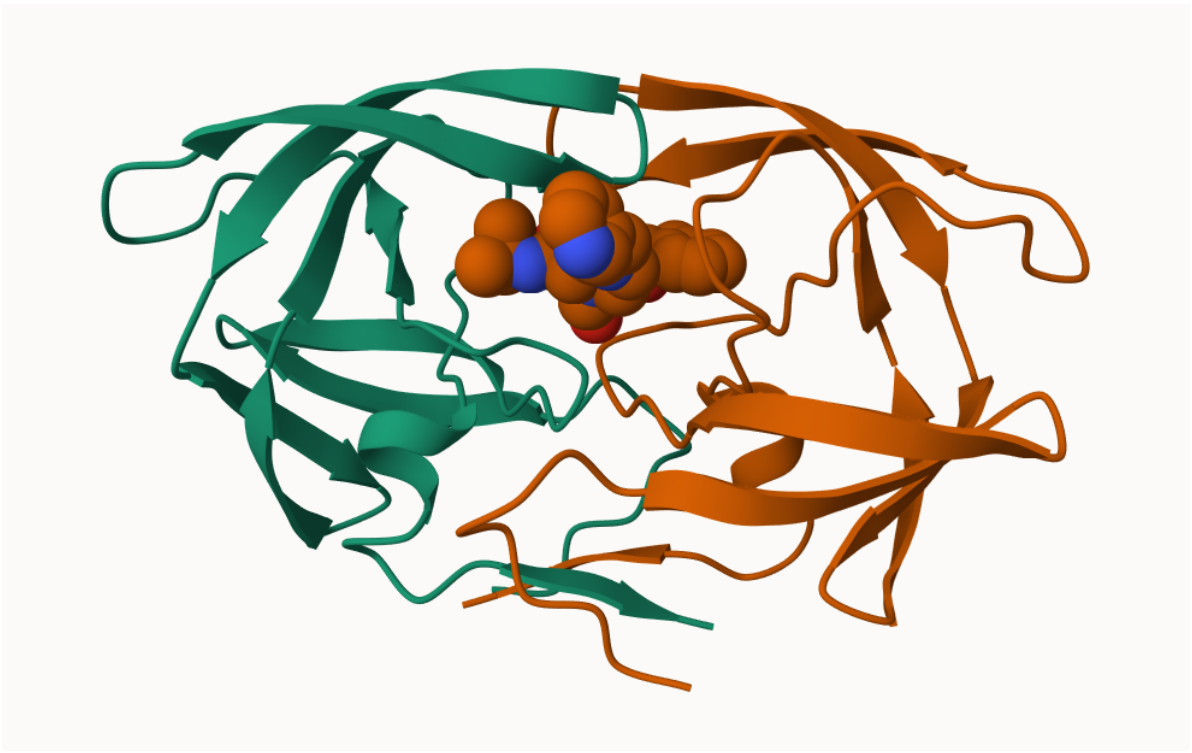
## 2. Visualizing Protein Structure

We will learn the basics of Mol * (mol-star)homepage: https://molstar.org/viewer/

We will play with PDB code 1HSG



Show the ASP 25 amino acids:

### Back to R and working with PDB structures

Predict the dynamics (flexibility) of an important protein

```
library(bio3d)

hiv <- read.pdb("1hsg")
```

```
 Note: Accessing on-line PDB file
```

```
hiv
```

```
Call:  read.pdb(file = "1hsg")

Make a "movie" called a trajectory of the predicted motions:

```
mktrj(modes, file="adk_m7.pdb")
```

Then I can open this file in Mol*
